

**Abstract**

- sub A<sup>2</sup>
- Novel pharmaceutical compositions comprising desglymidodrine or a pharmaceutically acceptable salt thereof as an active drug substance. Desglymidodrine is the active
- 5 metabolite of the prodrug midodrine. The pharmaceutical composition may be presented in a suitable dosage form for oral, parenteral, mucosal, nasal, sublingual, buccal, topical, vaginal, rectal or ocular etc. administration. A pharmaceutical composition of the invention may be in the form of an immediate and/or modified release composition or it may be designed to release the active drug substance, desglymidodrine, in a relatively fast
- 10 manner in order to enable a relatively fast onset of the therapeutic effect. The compositions have a suitable shelf-life, i.e. the desglymidodrine contained in the composition is not subject to a significant degradation under storage conditions normally acceptable for pharmaceuticals.
- 15 Also disclosed is a method for treating animals such as, e.g. mammals and humans with a novel pharmaceutical composition comprising desglymidodrine.

Furthermore, is disclosed a novel use of desglymidodrine in the treatment of septic shock and to a method for treating mammals (e.g. humans) suffering from septic shock with a

20 sufficient amount of desglymidodrine.
